ASTROPHOTOGRAPHY &

An Introduction to Shooting the Night Sky by Temu Nana

BEGINNER ASTROPHOTOGRAPHY

- Required Equipment
- Preparing for a Night Shoot
 - Camera Settings
 - How to Focus & Frame
 - Exposure Settings
 - Evaluating Your Images

Required Equipment

1. Camera that can be put in full manual mode:

- Mirrorless

- DSLR

- 2. Lens that can be focused manually: - f/4 or below
- 3. Tripod w. Head
 Mobility matters, stability matters more
 Any head will work
- 4. Headlamp: Red light option
 - Strong, small flashlight
- Recommended (Optional): Electrical tape
 - Remote shutter/cable release

<u>Preparing for a Night Shoot</u>

- Tripod
- 1. Familiarize yourself with your equipment: Headlamp
 - Camera buttons
- 2. Fully Charge multiple batteries for all components
 - Single bag (if possible)
- 3. Packing: - Take everything with you (even in your backyard)
 - Moon Phase & Rise/Set
 - Cloud Cover
- 4. Date/Location Specifics:
- Temperature
- Bugs
- Location Access

Camera Settings (Non-Exposure)

- 1. Camera and Lens in FULL MANUAL
- 2. File Type: Must shoot RAW, not JPEG
- 3. White Balance:

4. Drive Mode:

- AUTO is fine, will adjust in post-processing
- Can also use Custom or K, as you wish
- If shooting by hand, select "2-sec"
 - If using remote, select appropriate drive mode
- 5. Image Stabilization/VR Turned ON: Could be body or lens
- 6. Long Exposure Noise Reduction Turned OFF

<u>Focusing w. LCD Screen at Night</u>

- Balance/secure tripod
- 1. Set Up & Turn On all equipment:

2. Set ISO and Aperture for Rough Focus:

- Set camera/lens to manual
- Attach components
 - ISO 3200/6400 - Lowest f-stop
- Set just before infinity symbol
 - Use digital zoom (5x)
 - Center the star
 - Max digital zoom (10x)

You can use a star that is not in your intended frame

5. Manually Focus the Star:

Star should be small and sharpSecure focus ring with tape!

4. Use LCD Screen to Find a Star:

3. Set Focus Distance on Lens:

<u>Framing at Night</u>

- 1. Use Light on Foreground Object:
- Flashlight or headlamp
- Light marker/phone
- Trial and error if no light
- ISO 3200/6400
- 2. Use LCD Screen to Frame Stars:
- Lowest f-stop
- Use bright stars as markers
- 3. Level the Horizon: Use the electronic level in your camera
- 4. Leave Room in Frame to Crop/Straighten in Post-Processing

If you have CHANGED your FOCAL DISTANCE, you MUST REFOCUS!

<u>Camera Settings</u> (Exposure)

EXPOSURE SETTINGS ARE <u>ALWAYS</u> SITUATION DEPENDENT!

1. Aperture:

2. **ISO**:

- Start with lowest possible f-stop (wide open)
- If conditions allow, could stop down 1x or 2x
- Lowest possible ISO to achieve usable image
- Usually 800-3200, depends on equipment/conditions
 - Shortest possible to achieve usable image
- 3. Exposure Length: Can vary based on cardinal direction
 - Use "300 Rule" as a VERY GENERAL guide

Equation to Determine VERY GENERAL Exposure Length for Pinpoint Stars (No Trailing)

* (Focal length of lens) x (crop factor of camera/sensor)

Example Using 16mm Lens

Full Frame Cameras

(Crop Factor = 1x)

300/16mm = 18 secs

Cropped Sensor Cameras

(Crop Factor = 1.5x, 1.6x, 2x)

Nikon (1.5x): 300/24mm = 12 secsCanon (1.6x): 300/25mm = 12 secsSony (2x): 300/32mm = 9 secs

Evaluating/Checking Your Images

1. Don't Judge Image on LCD Screen!: - JPEG image & small

- 2. Histogram, Histogram, HISTOGRAM:
- Mostly in dark/left third
- Clipping can be present
- Do not over expose stars
- 3. Check Stars & Horizon w. Digital Zoom:
 - If not level, will straightening cut off composition?
 - Look for oblong stars or star trails
 - Inspect the WHOLE sky, not just one corner

INTERMEDIATE ASTROPHOTOGRAPHY (Star Trails)

- Required Equipment
- Framing (Cardinal Direction)
 - Camera Settings
- Equipment/Exposure Settings
- Suggestions for Post-Processing

<u>Required Equipment</u>

1. Camera that can be put in full manual mode:

2. Lens that can be focused manually: - 12-24mm - f/4 or below

3. Tripod: - Mobility matters- Stability matters more

- 4. Headlamp: Red light option
- 5. Intervalometer: Sometimes in camera, usually an accessory
 - Strong, small flashlight

<u>- DSLR</u>

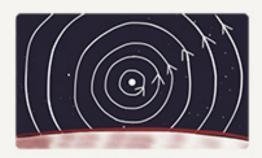

- Mirrorless

Recommended (Optional):

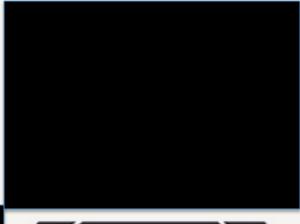

- Electrical tape

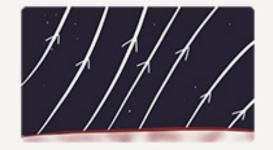

Star Trails - Northern Hemisphere

Depending on the direction you're aiming your camera, you'll get all these different star trails patterns.

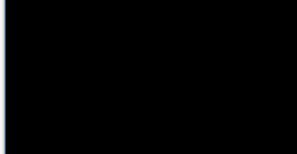

North

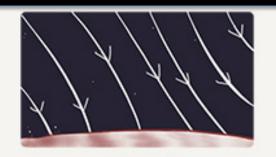

East

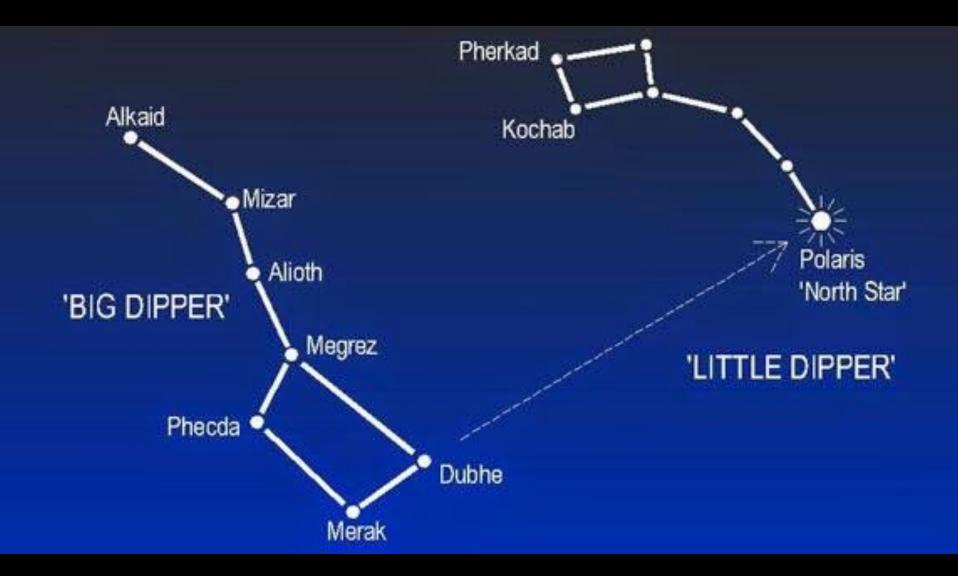

West

<u> Framing/Planning Star Trails</u>

1. Choose Star Trail Effect:

- Circular vs. Curved

- Cardinal direction determines effect

- 2. Moon Phase:
- You CAN shoot during full moon!
- Beware if moon will enter your frame
- 3. Foreground Objects:

- More effective, but more challenging

- Use silhouetted object when starting
- 4. Weather: Need fully clear skies, no clouds
- 5. Time Needed: Plan on 1-2 hours of shooting time
- 6. Batteries: Fully charged battery/ies or battery grip
- 7. The Cocktail You Plan to Enjoy While Your Camera is Working!

Camera Settings (Non-Exposure)

1. Lens in FULL MANUAL, Camera in MANUAL or BULB

2. File Type: - RAW is best, but JPEG will be used for final image

- AUTO is fine, can adjust in post-processing

- Can also use Custom or K, as you wish

4. Drive Mode: - Select appropriate drive mode for remote or built-in intervalometer

5. Image Stabilization Turned ON: - Could be in body or on lens

6. Long Exposure Noise Reduction Turned OFF

3. White Balance:

Equipment/Exposure Settings

EXPOSURE SETTINGS ARE <u>ALWAYS</u> SITUATION DEPENDENT!

- Start with lowest possible f-stop (wide open)
- If conditions allow, could stop down 1x or 2x
- Lowest possible ISO to achieve usable image

1. Aperture:

- Usually 800-1600, depends on equipment/conditions

- Do you want to use individual frames?

* If yes, determine max exposure length & adjust other settings to taste

* If no, I suggest 30-60sec exposures

- No limits since star trails are what we want!

3. Exposure Length:

Equipment/Exposure Settings (cont.)

3. Exposure Length:

- Do you want to use individual frames?

- * If yes, determine max exposure length and adjust other settings to taste
- * If no, I suggest 30-60sec exposures
- No limits since star trails are what we want!
 - Exposure Length (30s or 60s)
 - Number of Exposures (1hr/2hr/3hr)
- 4. Intervalometer Settings:

- * **30s**: 120/240/360
- * <mark>60s</mark>: 60/120/180
- Interval between exposures

* Shortest possible time to record image on card and shoot next image: 2-5 secs (?)

Star Trail Exposure/Equipment Settings

ISO: 1600 Aperture: f/4 - f/5.6

Exposure Length: 30sec or 60sec Number of Exposures: 120 - 360 Interval: 3 - 5secs

Post Processing

1. Download/Install StarStaX (FREE):

- https://markus-enzweiler.de/software/starstax/
- Windows or Mac
- 2. Edit/Export Your Images:
- If RAW, edit (ALL) and export as JPEG
- If JPEG, edit (ALL) and save
 - Import JPEGS
- 3. Use StarStaX to Build Image:
- Choose blending mode (Gap Filling)
- Press "Start Processing"
- Watch the build (w. cocktail)

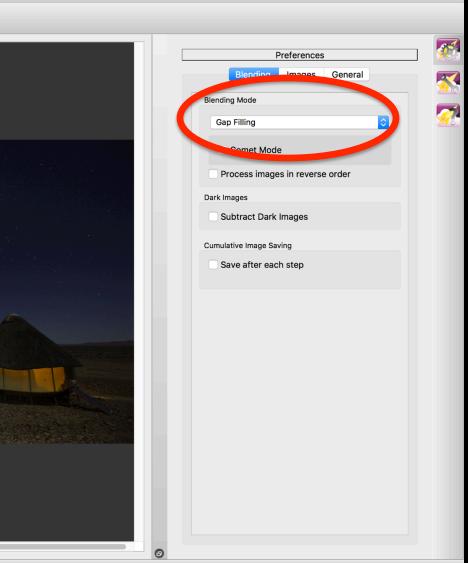

Image info: 5760 x 3840 pixels, 32-bits per pixel

- 1. Star Trail "Build":
 - Short video of star trails forming
 - Select "Cumulative Image Saving" in StarStax
 - Use these images to build short time lapse
- 2. Time Lapse: <u>Use Photoshop to make Time Lapse</u>
 - File > Open Select FIRST JPEG of star trail images
 - Check "Image Sequence"
 - Click "Open"
 - Select 15 or 24 FPS (frames per sec)
 - Window > Timeline (brings up timeline view)
 - Spacebar to preview time lapse
 - File > Export > Render Video
